Independent timing-noise check and equal-window EP comparison
SFLS: theory
EP: theory
SFLS: simulation
EP: simulation
Frequency STD (Hz)
10^{-3}
10^{-4}
10^{-5}
10^{2}
10^{3}
Observation span (ms)
2,048 independent trials per window; bars: 99.9% STD intervals.
20 ns independent timing noise; no quantization. SFLS time exponent: -1.487.
